

Strategic Innovation Promotion Program / Automated Driving for Universal Services

Prototyping and testing of Dynamic Map Platform for study and consideration of issues and resolutions of Automated Driving for Universal Services

Report (Summary)

March 2018

Dynamic Map Service Platform Consortium

Project summary

- Following items were considered and studied to realize the dynamic map service platform.

Step	Content
① Consideration of data linked to dynamic map	Considering data which has needs, based on last years project(Study and consideration to construct the “Dynamic Map Service Platform”)
② Consideration of concrete use method of dynamic map information	Planning a service model which is able to be proposed to concrete user, in each of 6 fields, and revealing data flow of each service model.
③ Demonstration of service models	Making prototypes of service models which is planed in step ②, and demonstrating business and architecture of each service model with collecting actual information.
④ Demonstration of service platform	Putting each data which is used in step ③ into the prototype of the dynamic map service platform, and considering the value of the dynamic map service platform by visualizing and cataloging the data.

Selection list of information that link to dynamic map

■ Following information was procured.

Category	No.	Information	Information Provider	Information Procurement Company	
Quasi-dynamic information	1	Vehicle probe information (Truck)	Carrier	FUJITSU	
	2	Vehicle probe information (Taxi)	Taxi company	FUJITSU	
	3	Vehicle probe information (Bus)	Bus company	NEC	
	4	Vehicle probe information (Construction vehicle)	Construction Company	OKI	
	5	Tweet	Twitter	NTT DATA	
Quasi-static information	6	Advanced traffic information (Including road lane information)	PIONEER	PIONEER	
	7	Weather information (Halex Dream!)	Halex	NTT data	
	8	Mobile spatial statistics (Population distribution)	DOCOMO InsightMarketing	NTT data	
	9	Rapid deceleration frequent occurrence spot information	PIONEER	OKI	
Static Information	10	Facility Information (Public facility, Doorway, Designated evacuation shelter, etc)	Ministry of Land, Infrastructure, Transport and Tourism	HITACHI	
	11	Digital national land information (Waterlogged area, etc)		NEC	
	12	Road information where there is a risk of flooding	Local governments	FUJITSU	
	13	2D Map	Zenrin	FUJITSU	
	14	2D Map (Including points information where accidents occur frequently)	Increment P	PIONEER	
	15		SIP *1	FUJITSU	
	16	3D Map		Pedestrians crossing information	FUJITSU
	17			Road lane information	PIONEER
18	3D Map			FUJITSU	

*1 : The data that the Dynamic Map Consortium made in FY2016 was used.

Association chart of Dynamic Map Service Platform Prototype

■ The prototype was made and proven as shown in the figure below.

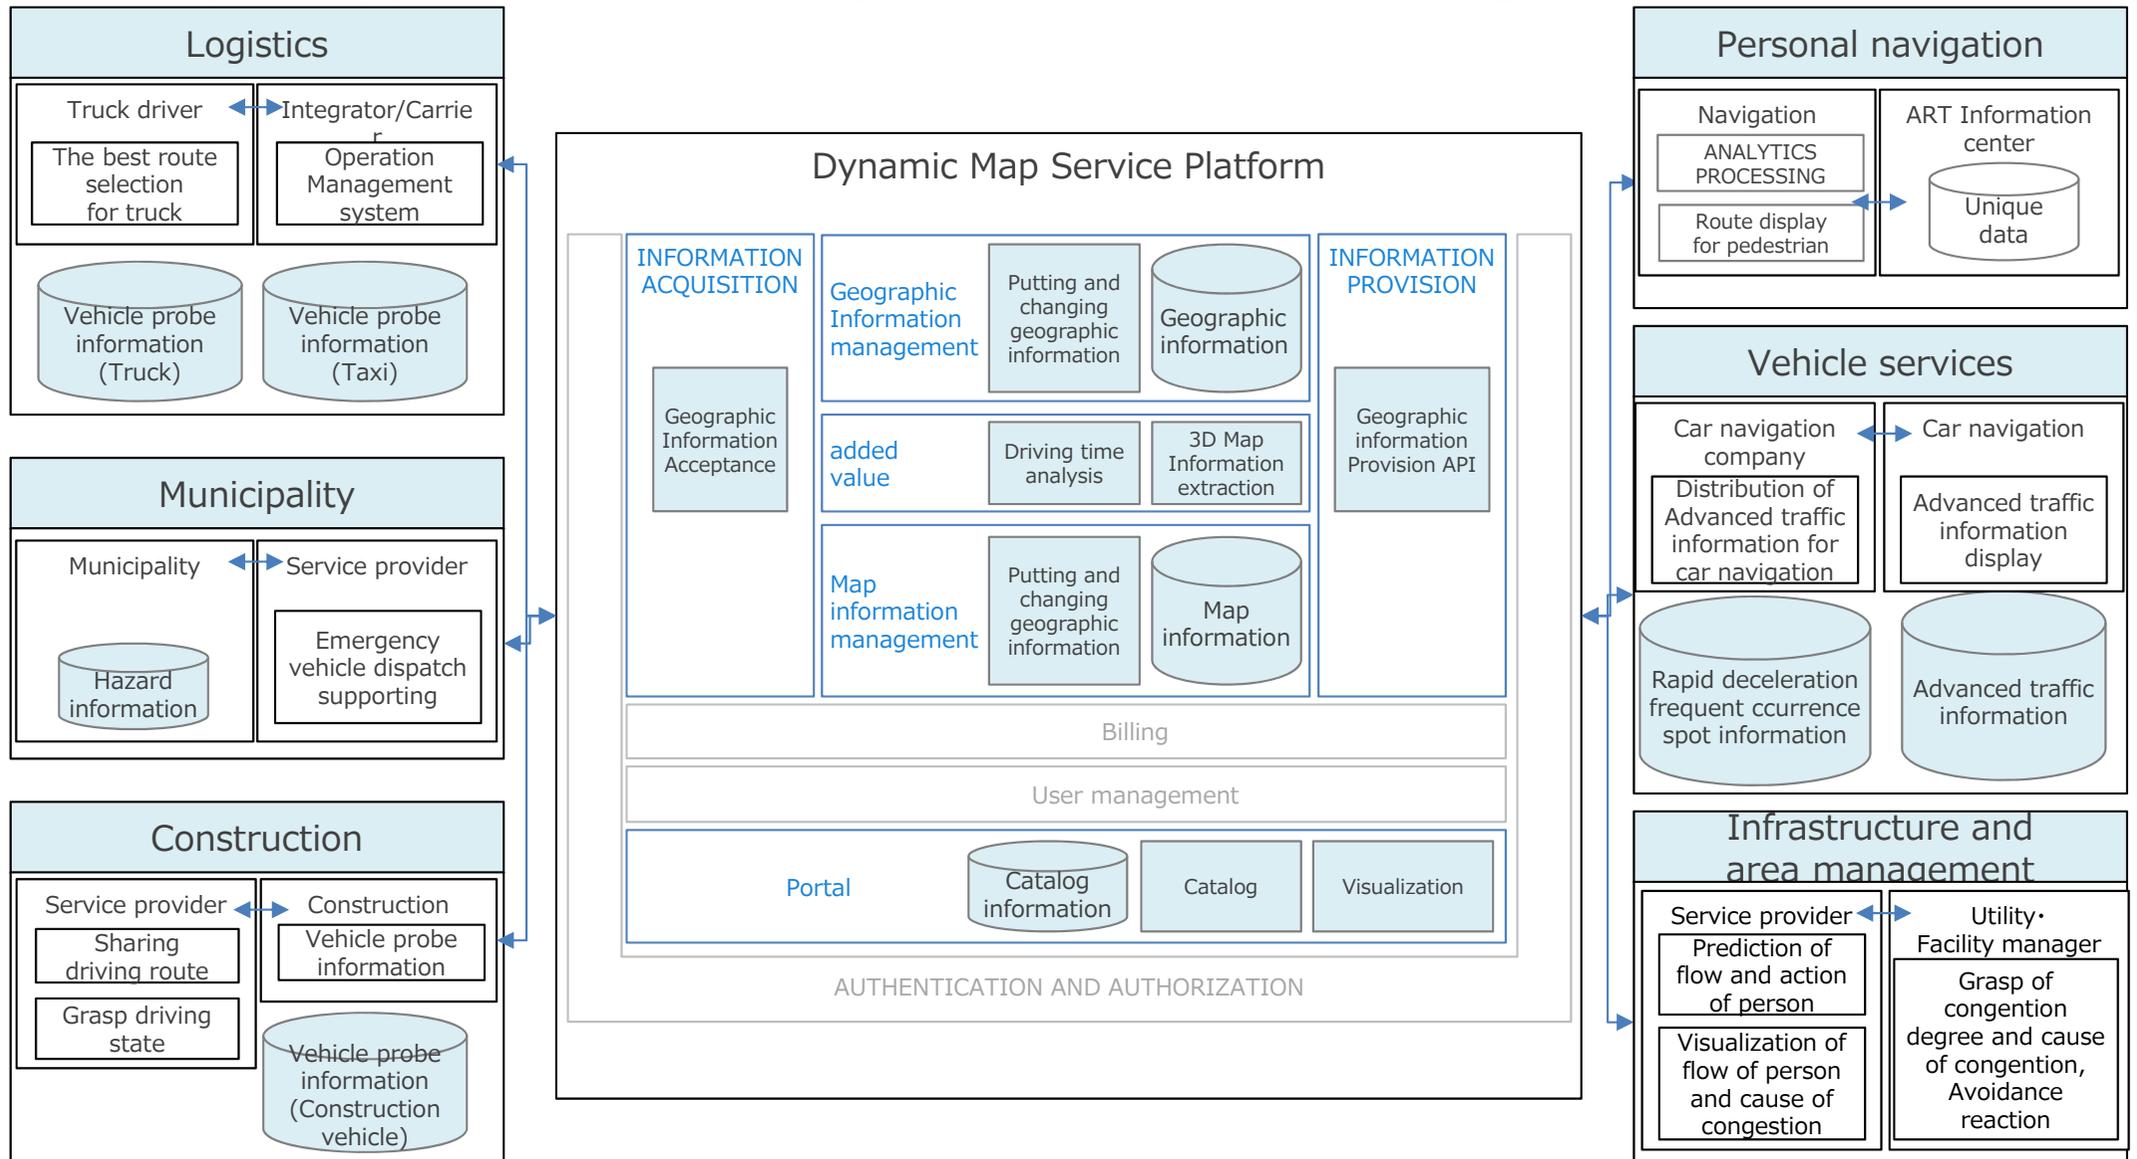

Diagram of demonstration environment of service model (logistics)

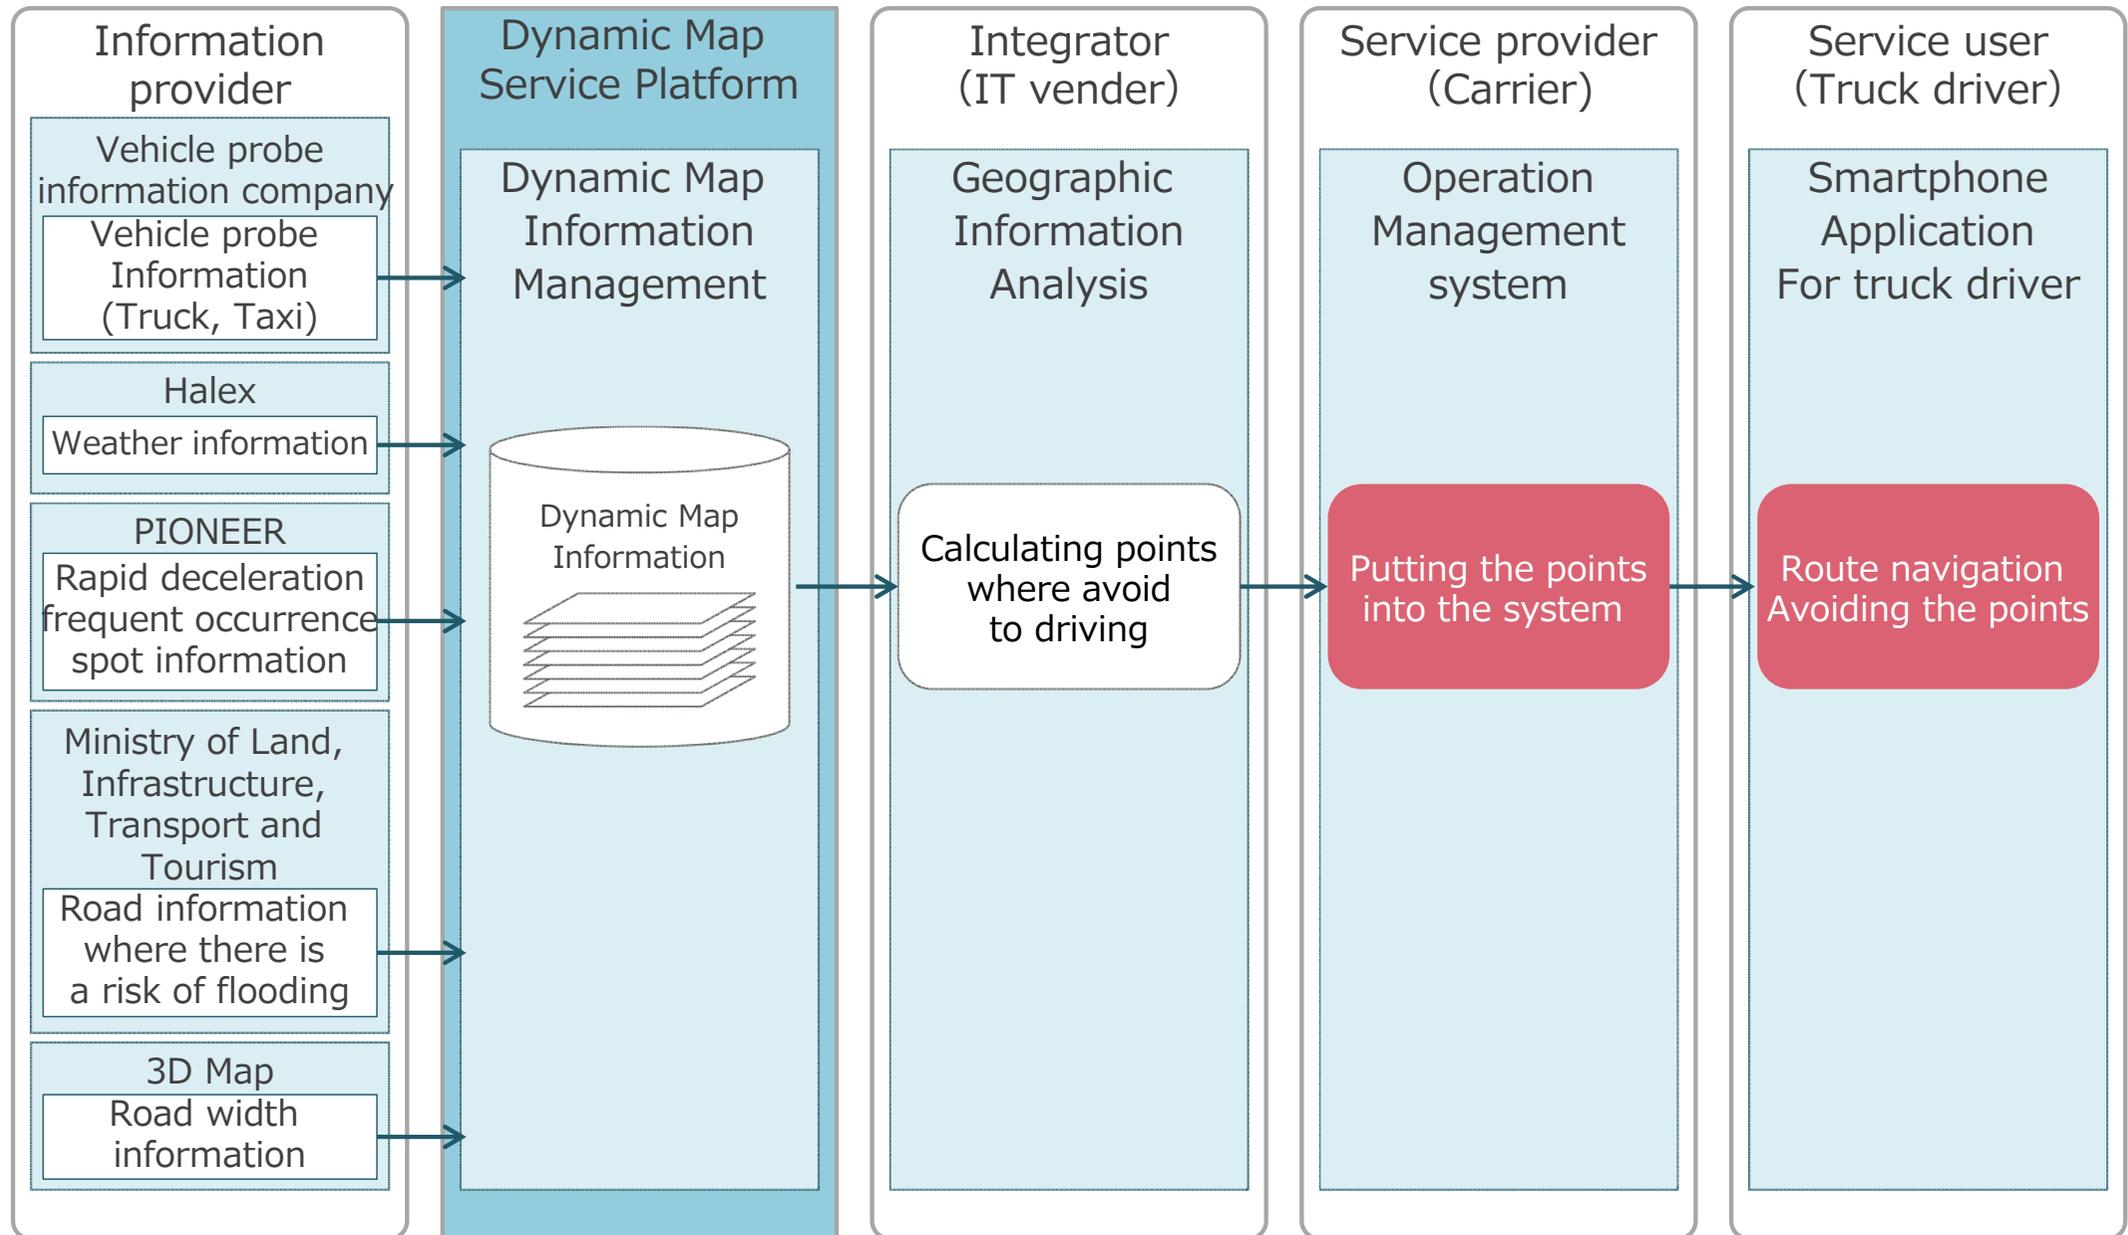

Diagram of demonstration environment of service model (Municipality)

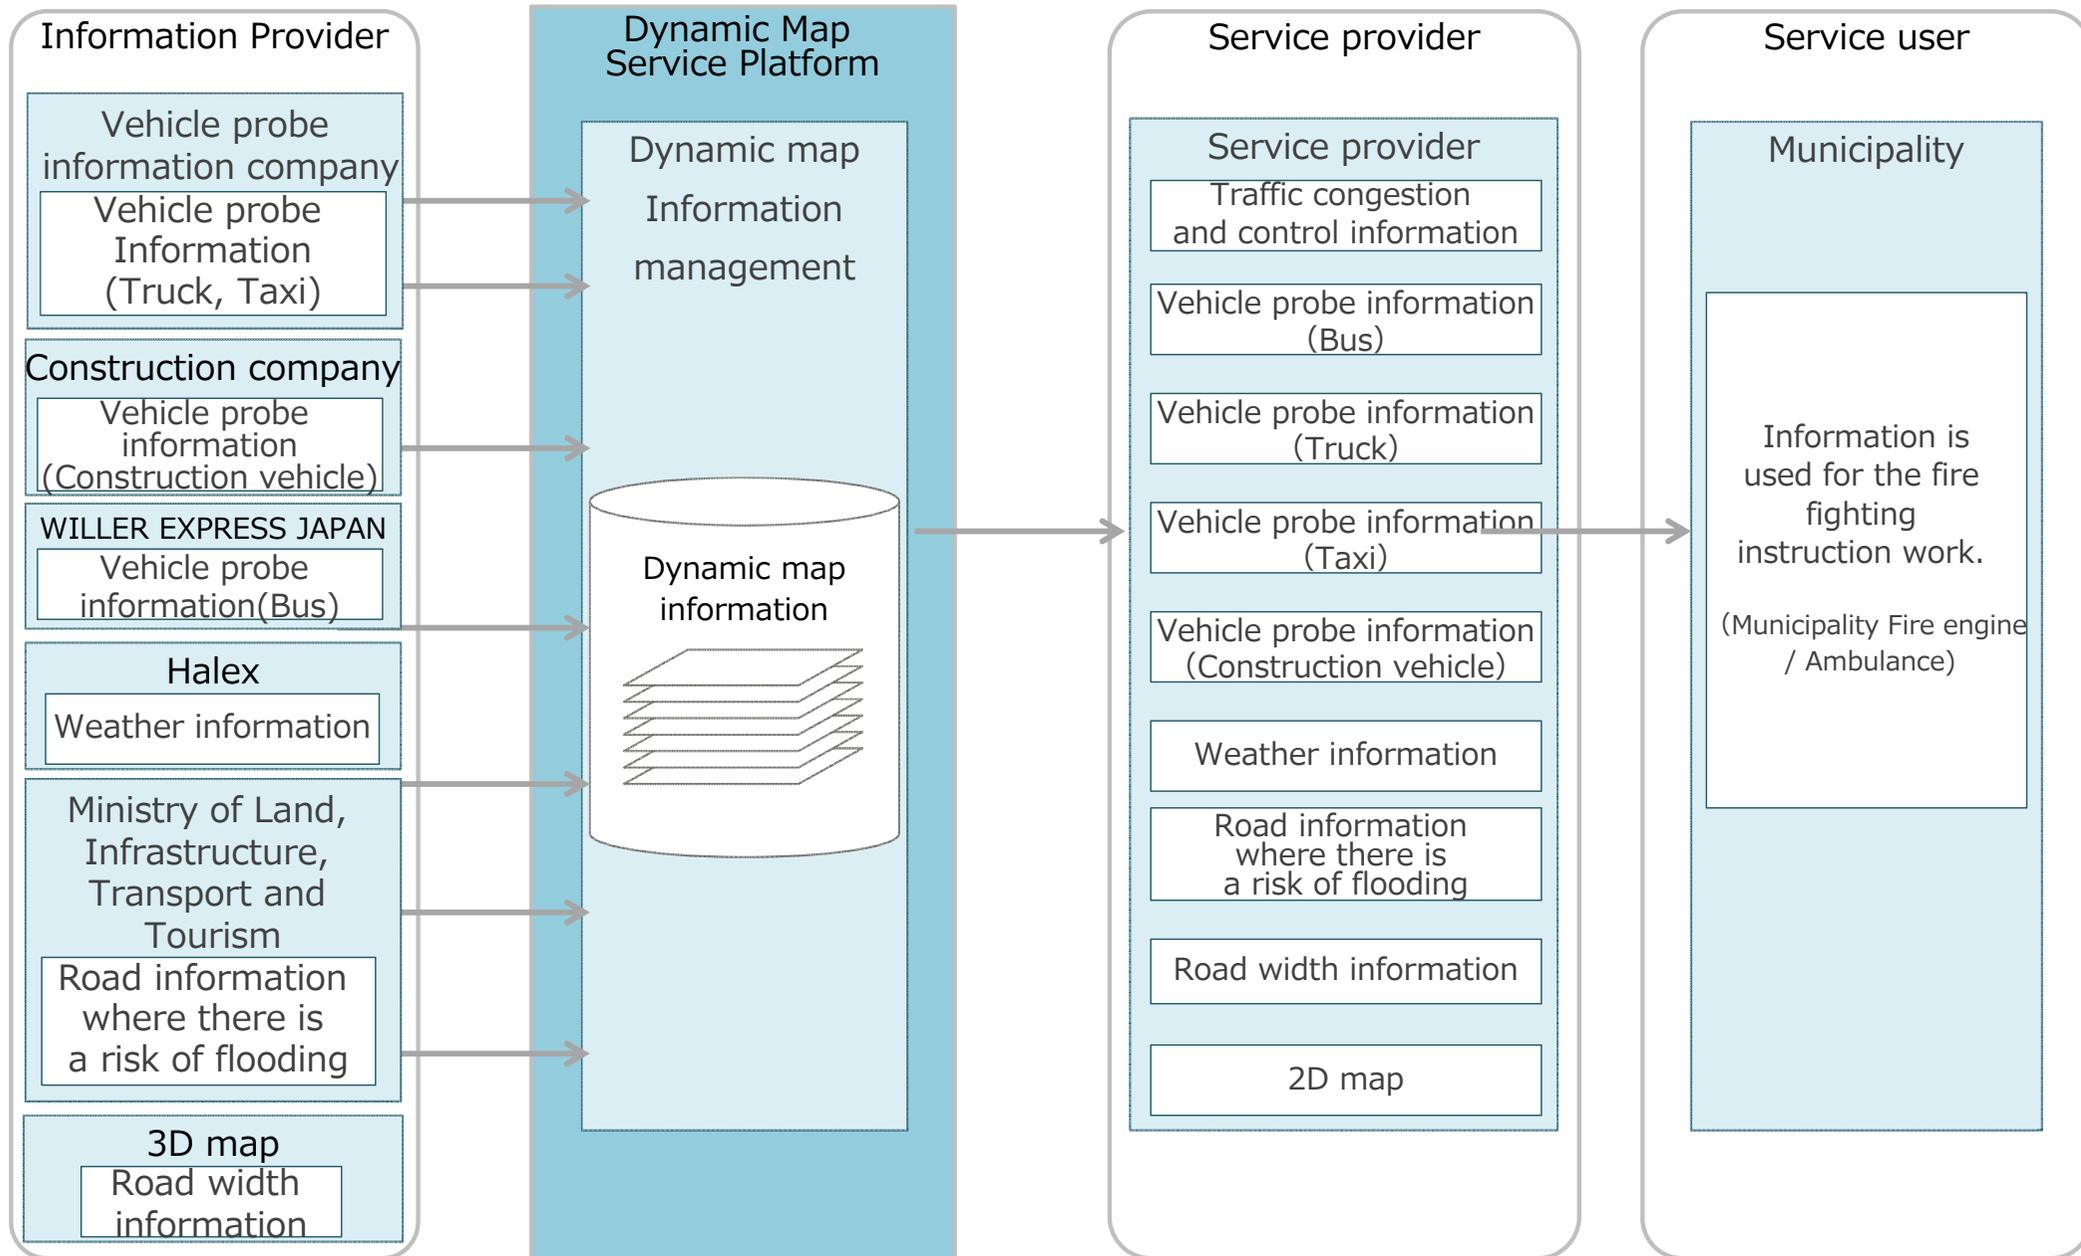

Diagram of demonstration environment of service model (Construction)

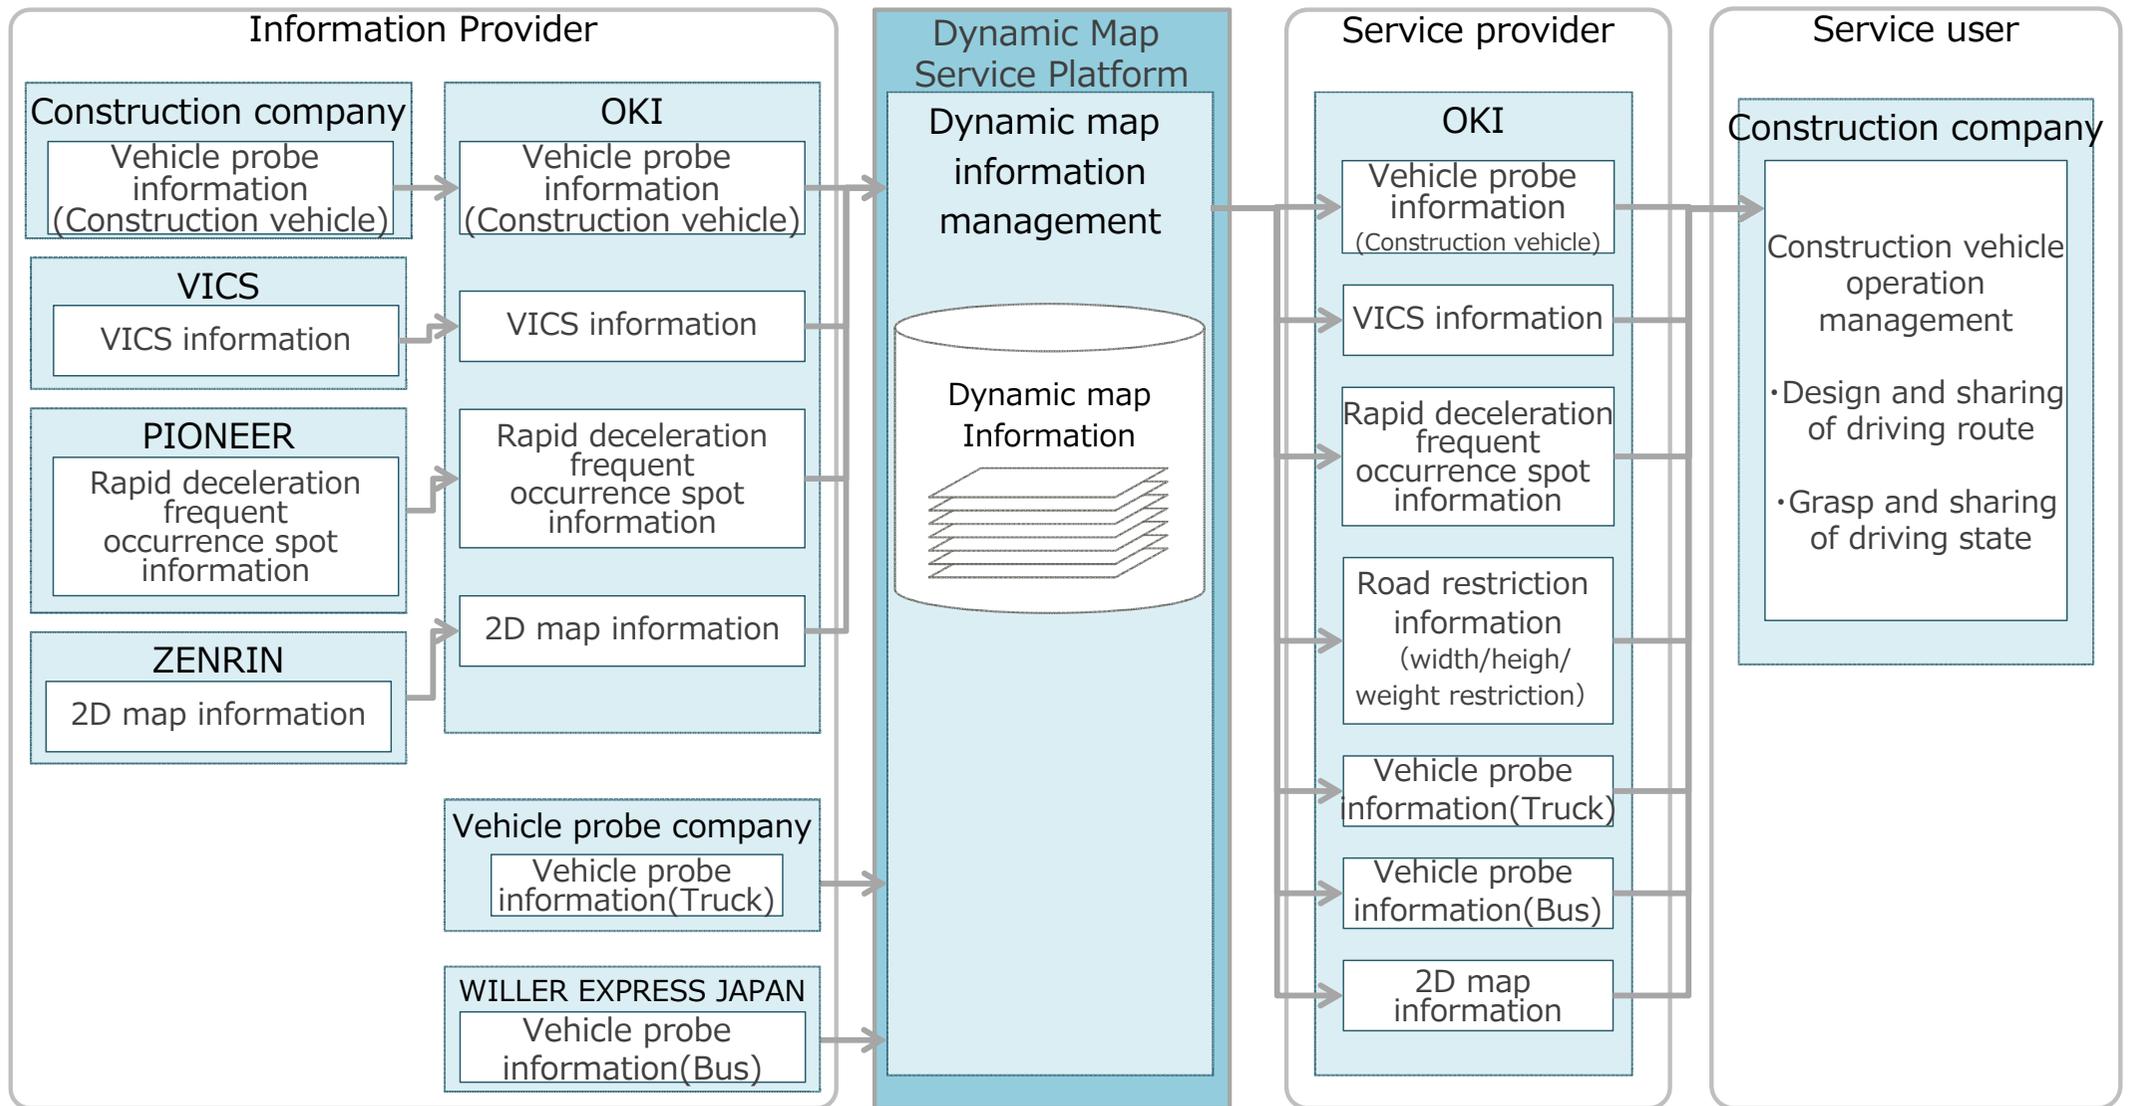

Diagram of demonstration environment of service model (Personal navigation)

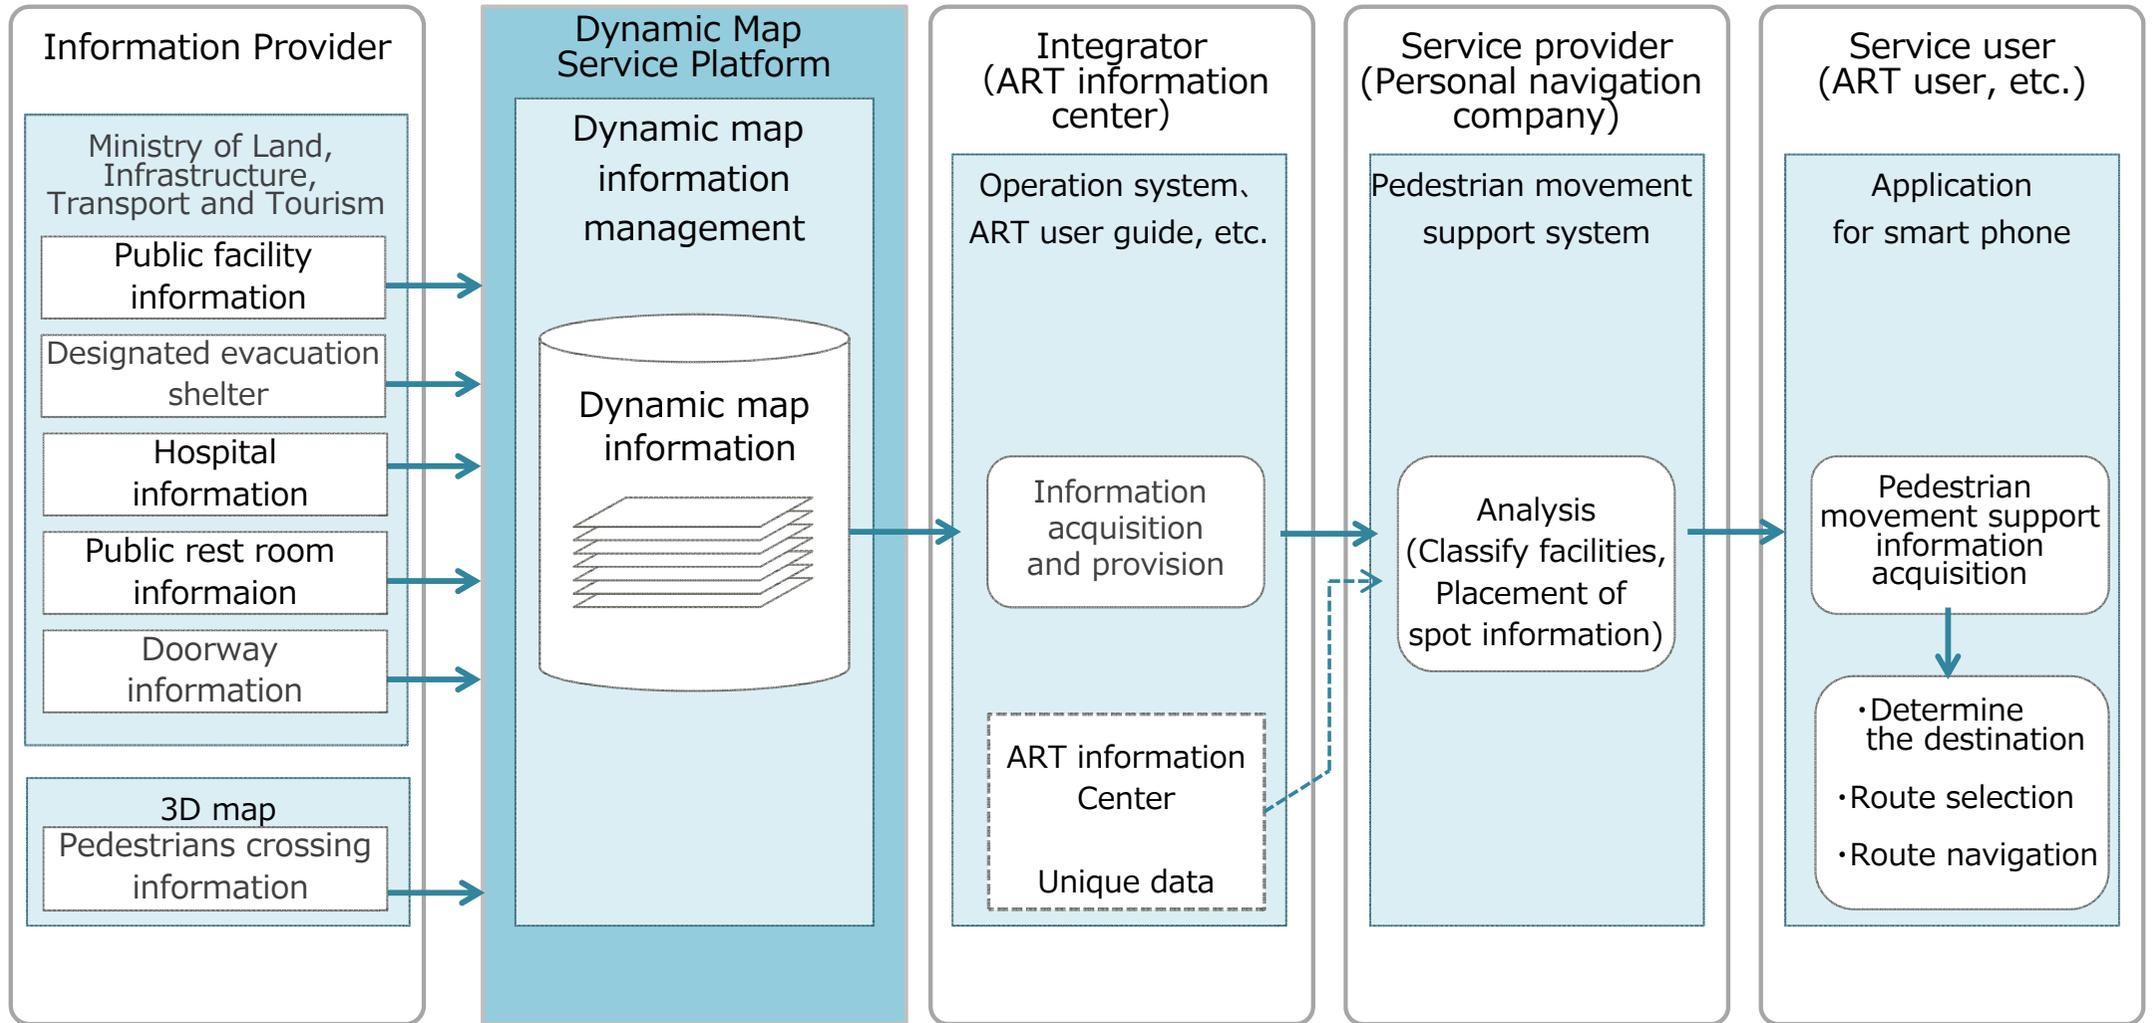

Diagram of demonstration environment of service model (Vehicle)

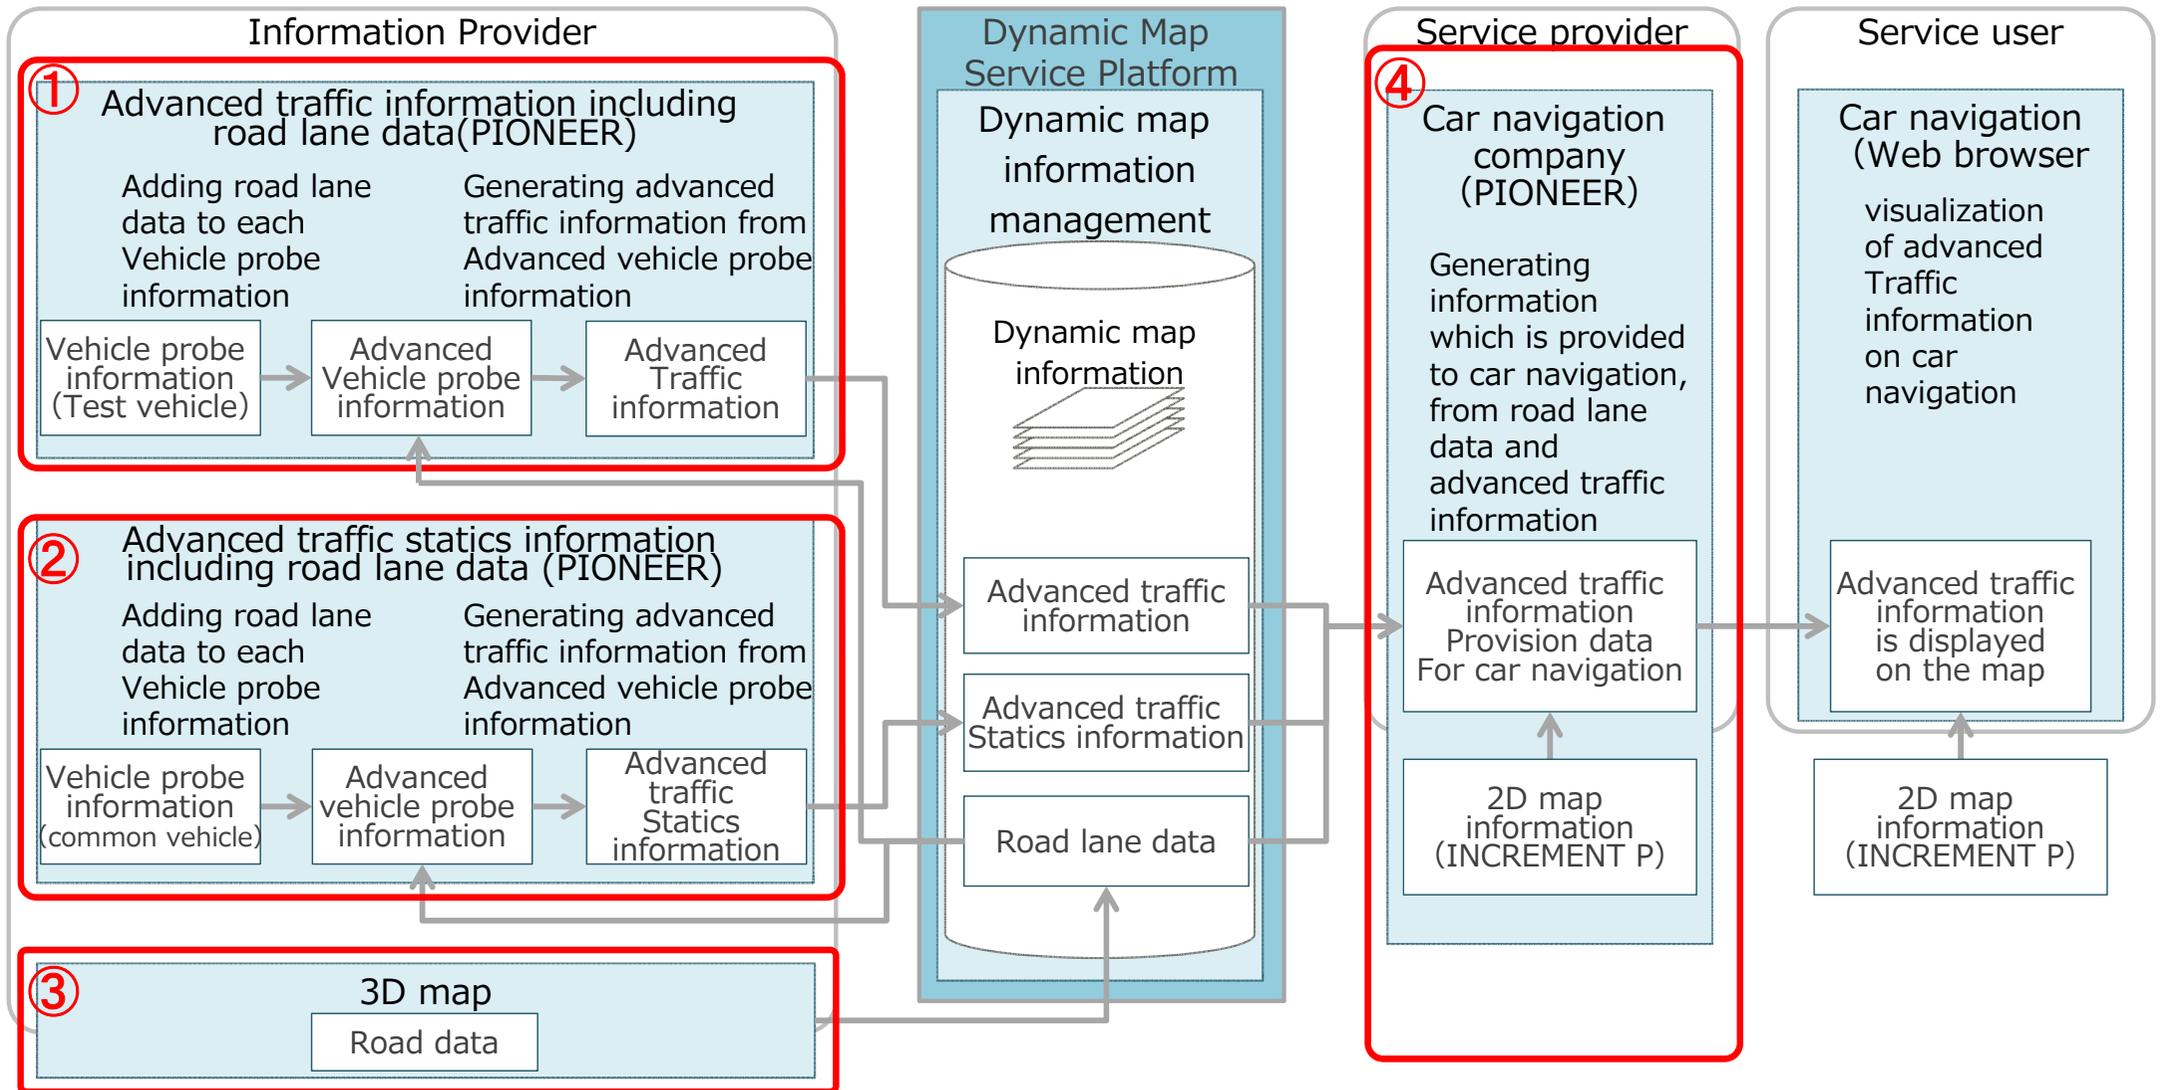

Diagram of demonstration environment of service model (Infrastructure and area management)

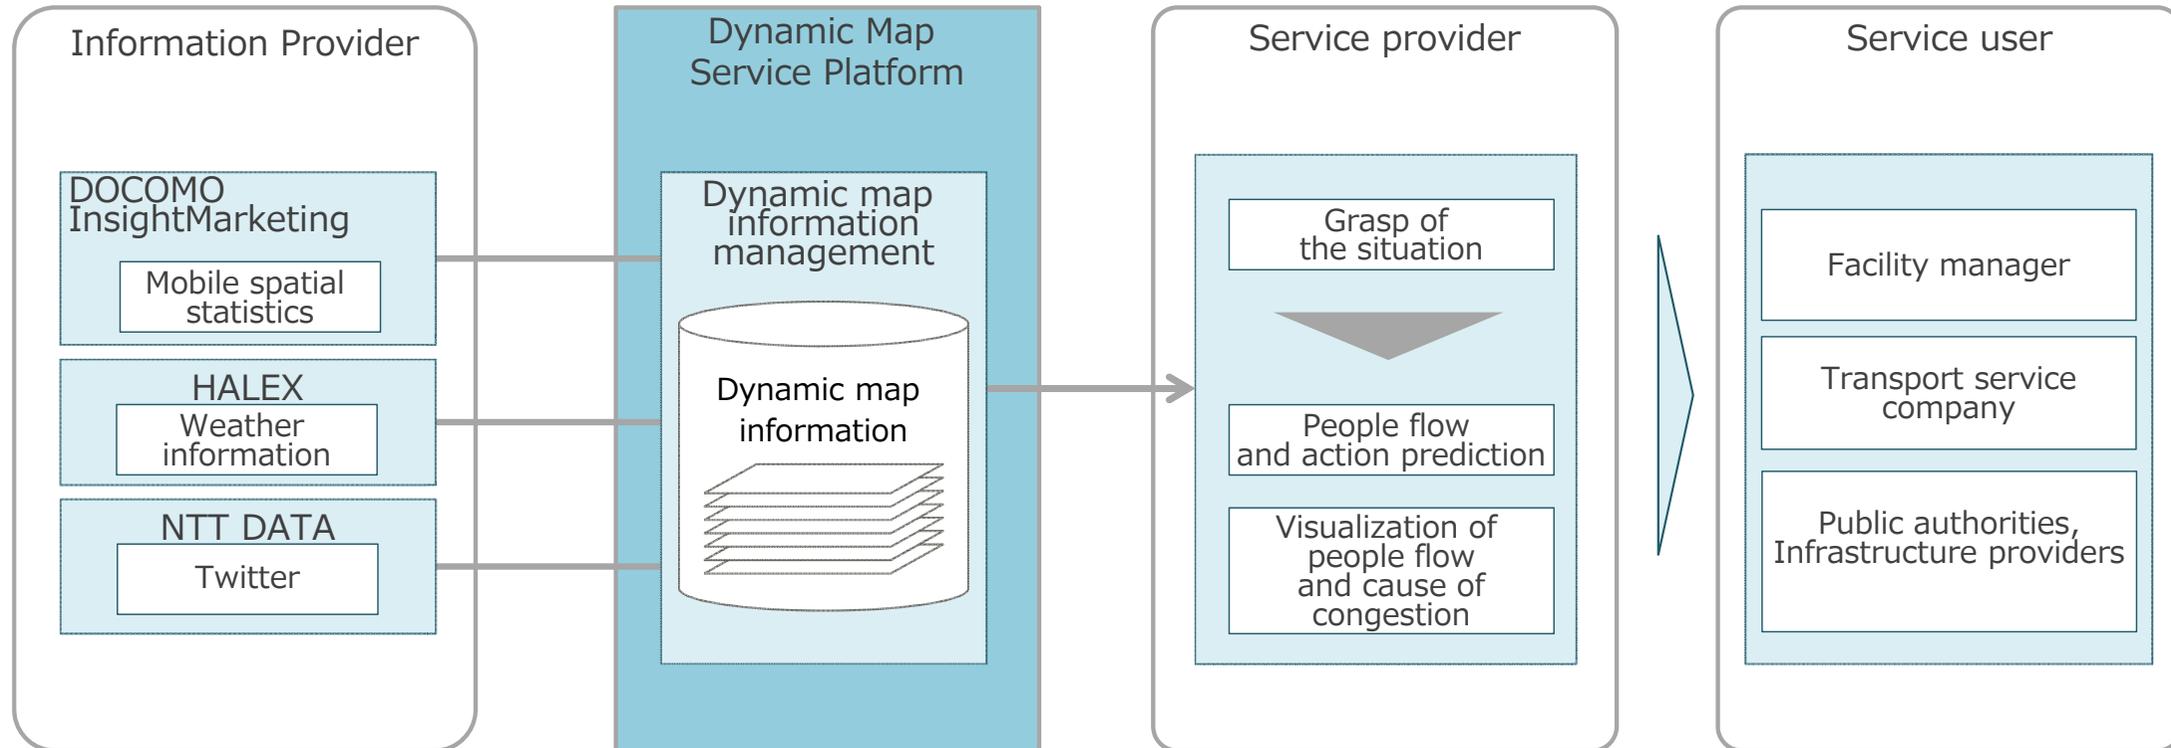

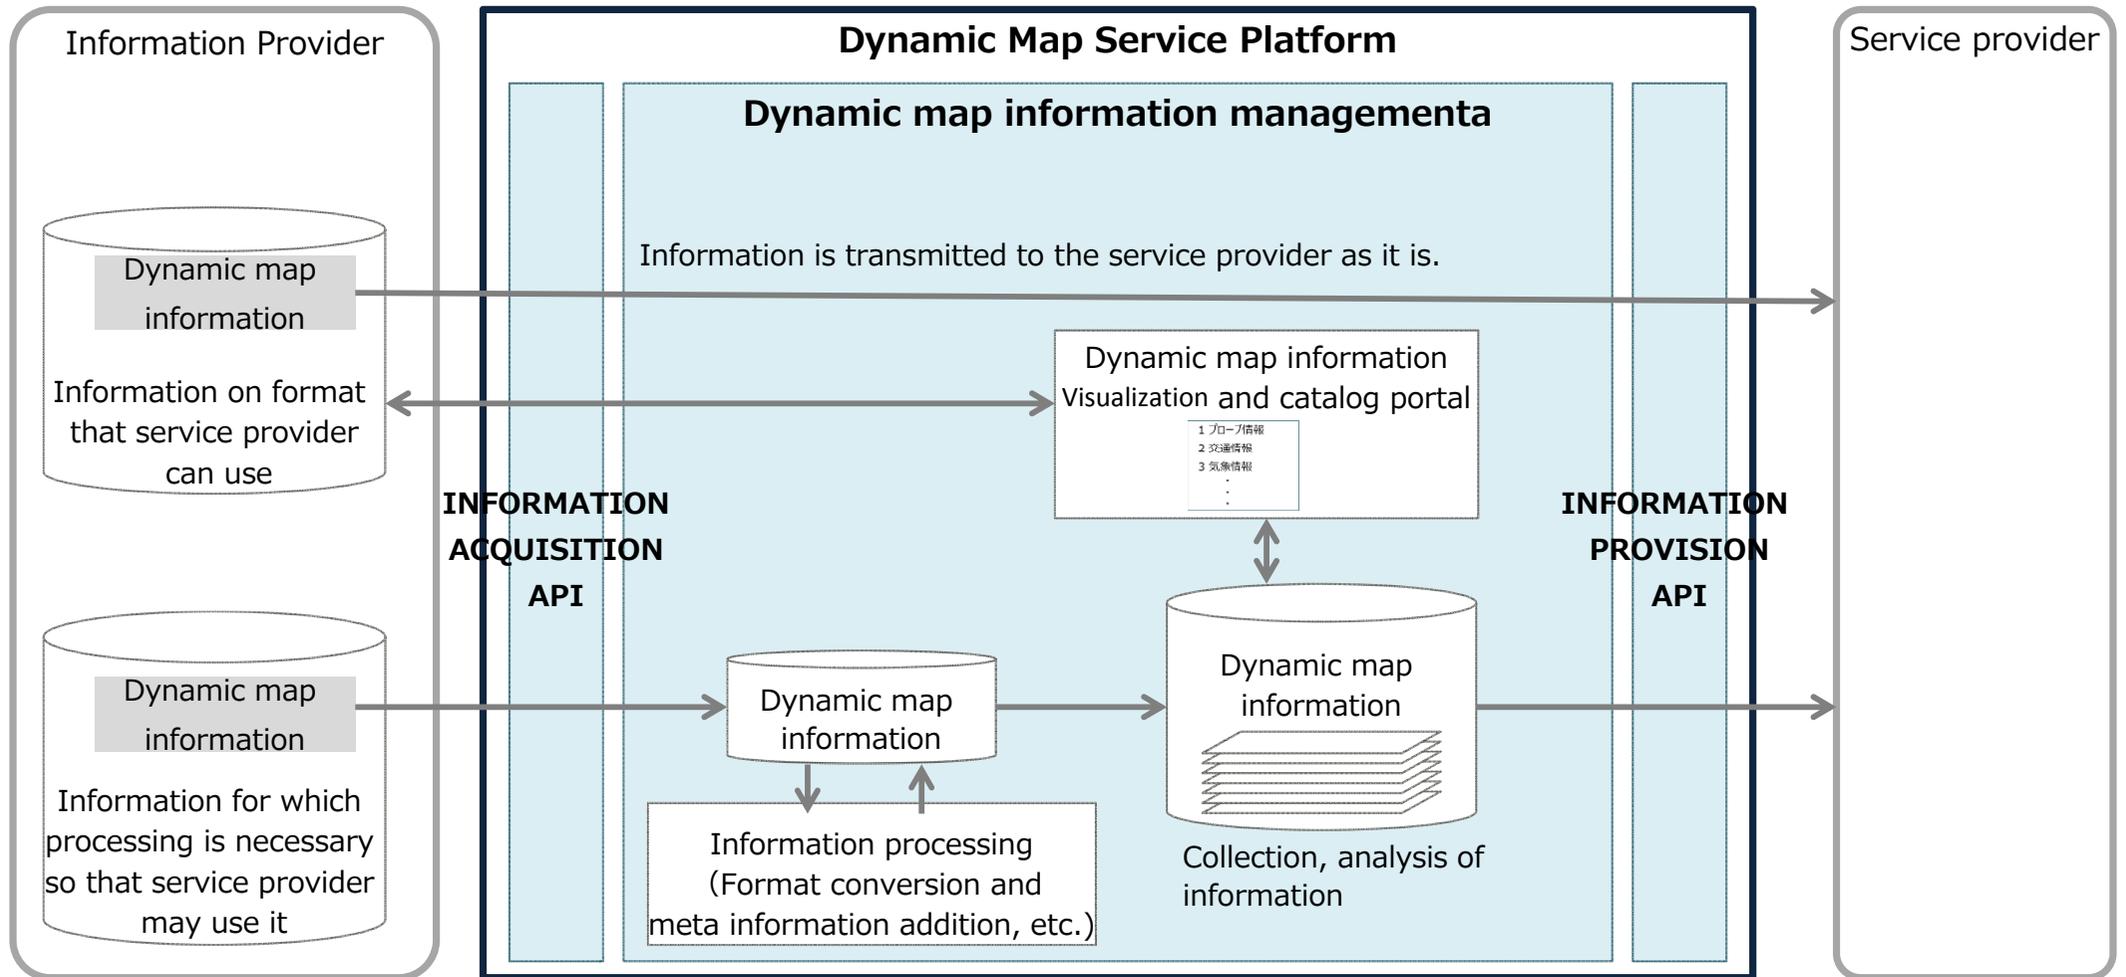

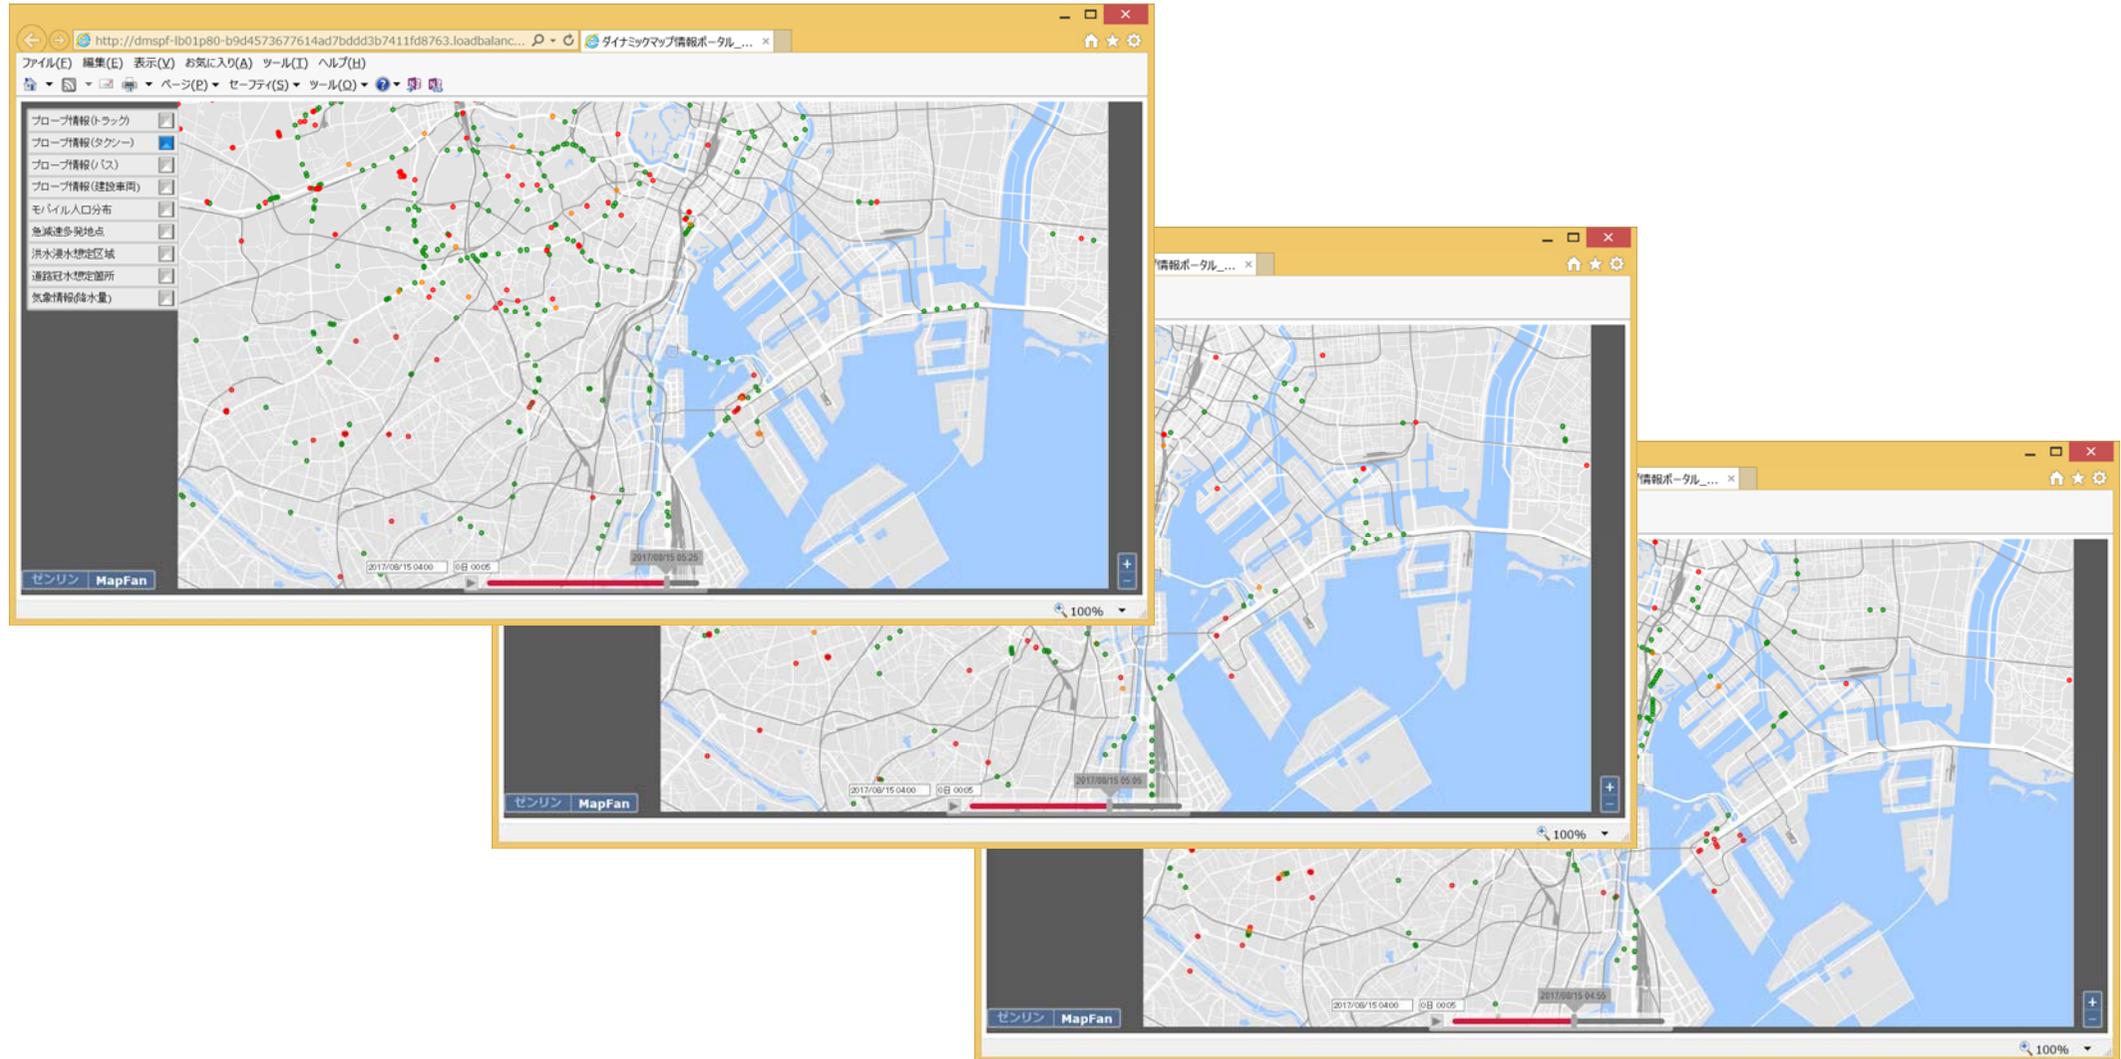

Diagram of demonstration environment of service model (Dynamic map information portal site)

Dynamic map data visualization portal site

- Visualization of information change over time as shown below

Visualization of time passage of Vehicle probe information (taxi)

Effectiveness of Dynamic map service platform

Effectiveness of dynamic map information

It was confirmed to be able to use dynamic map information which was collected in various fields and combined across various fields.

Especially, it was revealed that vehicle probe information was effective as follows.

- As the amount of vehicle probe information increases, the accuracy of the traffic density estimation improves.
- Multiple large vehicle probe information is useful to judge whether or not a road can be passed.

Effectiveness of common interface

It was clarified that **developing a common interface was able to reduce development man-hours** more than the interface was individually developed.
(6 interfaces of 3 service models were reduced)

Effectiveness of 3D map

The effectiveness of the information of road lane, road width and pedestrians crossing extracted from the 3D map was able to be confirmed.

- **Road width information has needs from multiple fields.** When the maintenance of the map of a general road advances, it becomes more effective.
- It was confirmed that the geographic information such as road lane, pedestrians crossing, signal for pedestrians, pavement and difference is effective **if it was extracted from 3D map as easy for use.**

Effectiveness of prototype function

- It was confirmed that meta data which is listed in the catalog portal can combine seeds and needs of dynamic map information.
- Visualizing dynamic map information was useful for the intuitive understanding of granularity, provision area, update frequency of dynamic map information.
- It was confirmed that dynamic map information could be used on multiple 2D map.

Project result

- We made prototype of 6 service models and dynamic map service platform, and hold hearing with companies which was assumed as user of the 6 service models.
- We substantiated the effectiveness of the 6 service models and the effectiveness of the service platform through the above approaches.

【Project result】

It was confirmed to be able to use dynamic map information which was collected in various fields and combined across various fields.

Especially, Vehicle probe information is indispensable to achievement of services.

The information which combines multiple kinds of vehicle probe information and real time traffic flow information based on vehicle probe information is needed for many services.

And it was also confirmed that the field where 3D map was used extends by taking out the feature from 3D map and offering it to service provider.

In this program, we made prototypes of 6 services and demonstrated to confirm whether the 6 services could offer assumed value to service users.

As a result, it was confirmed that each service model had marketability.

And after the we could deepen our knowledge of how to use dynamic map information and needs of dynamic map information as a result of hearing with companies.

It was proven to be able to support understanding the followings to provide catalog and visualization function.

- What each dynamic map information is
- What value is generated by combining dynamic map information

And it was also proven to connect to each service model system with making prototypes of information acquisition and provision function and geographic information management function which were needed to distribute dynamic map information.

It was confirmed to handle different dynamic map information with common interface, and requests about additional function of interface was extracted to from service providers.

Result of that, it was deepen to study of the interface.

Tasks for the future

- Following considerations are needed.

Providing real time information

System to provide dynamic map information in real time

Utilization of social information

System to get municipality public information

Providing of added value

Architecture to get and provide added value information such as images which are useful to visually grasp the traffic flow.
