03-04 April 2017 Cross-Ministerial Strategic Innovation Promotion Program SIP Automated Driving for Universal Services (SIP-adus)

TOGETHER, SHAPING THE FUTURE

Tasks with high priority

Task A

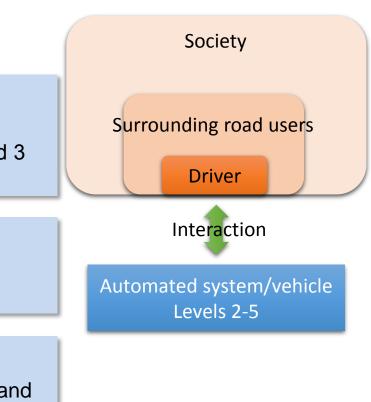

Task A investigates effects of system information (static and dynamic) on drivers' behavior in transition from Levels 2 and 3 to manual.

Task B

Task B investigates effects of driver state (readiness) with Levels 2 and 3 on his/her behavior in transition to manual.

Task C

Task C studies non-verbal communication between drivers and other road users, and investigates effective ways to functionalize the automated vehicle (Level3+) to be communicative.

CONFERENCE Connected and Automated Driving

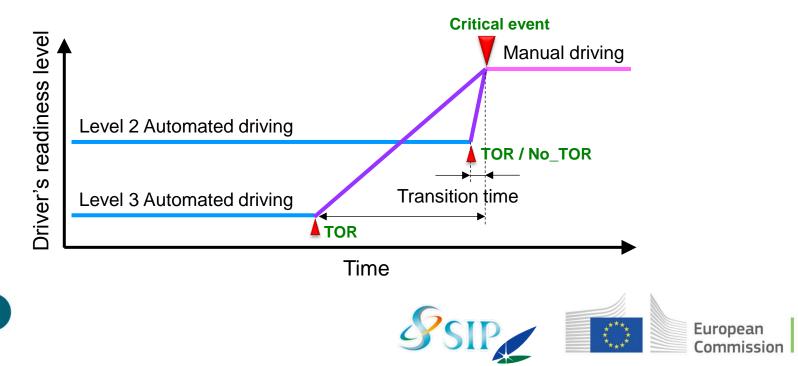

TOGETHER, SHAPING THE FUTURE

Goals

03-04 April 2017

Brussels

- To investigate effects of driver state (readiness) with Levels 2 and 3 on his/her ← Year 1 behavior in transition to manual and extract metrics of readiness for the driver monitoring system.
- 2. To define the transition time as a function of readiness.
- 3. To identify fundamental requirements of the HMIs for supporting the driver to stay with the appropriate readiness and to take-over the driving task smoothly (prototyping included).

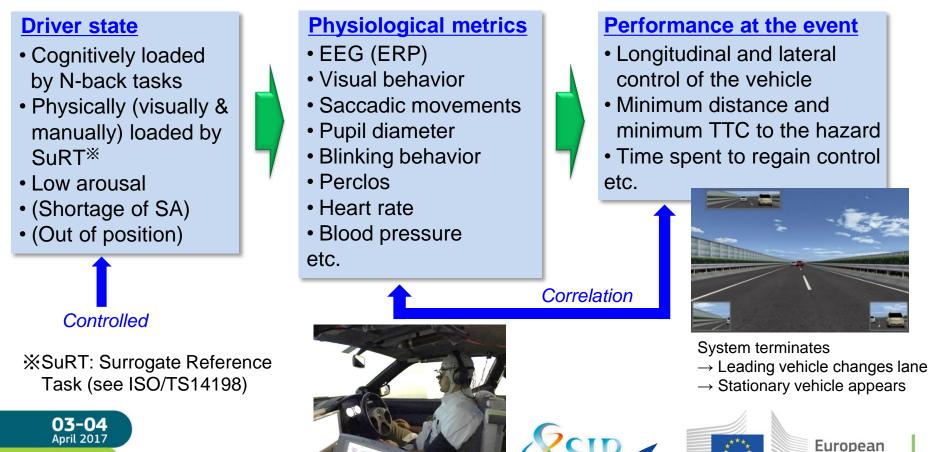

TOGETHER, SHAPING THE FUTURE

Experiential method

Brussels

Subjects drove Level 2 and 3 systems with cognitive and physical additional tasks in the driving simulator. The scenario included several events with low criticality. Subjects' physiological metrics were measured to extract those correlated with degraded performance in the events.

Conclusions

- 1. Driver state while driving with the system influences his/her behavior in transition from automated to manual after TOR. The behavioral changes in transition varies depending on the type of driver state such as cognitively loaded, physically (visually and manually) loaded, and low arousal.
- 2. Physiological metrics of driver state that degrades driver performance in transition have been extracted. Metrics measurable in a vehicle in real time are amplitude/frequency of the saccadic movements of the eyes, frequency of blinking, percent time of forward looking, and Perclos.
