

# The 2nd Phase of SIP-adus (2018-2022)

## Experiments of automated driving support in rural areas are underway.

Experiments of automated driving are currently underway at 13 roadside stations nationwide. It is expected to be implemented in 2020.

These stations are expected to serve as small hub in the future. These are located at the local authorities which face an aging society, that is, people of 65 years old or older account for 30% or more of the total population.

### Example of V2I

A system for recognising an electromagnetic guide line placed on the road surface can be built into the automated driving system, in order to enhance safety on roads in mountainous areas where road alignment tends to be less than optimal.
